

COREON HOLDINGS Co., Ltd.

Industrial Safety Execution Technology

Connecting safety signals to accountable action, evidence, residual-risk reassessment and verified closure.

4 PATENTS

T5 EVALUATION

VENTURE

SOFTWARE BUSINESS

CORE BUSINESS

- Industrial safety software / SaaS
- AI-assisted safety execution workflow
- Industrial safety patents / IP / R&D
- API & event integration / OEM / technology partnership

Industrial safety technology built on product, IP and execution

COREON supports standalone SaaS deployment, system integration, co-development and technology partnerships around industrial safety execution.

WHAT COREON BUILDS

COREON connects the gap between technologies that detect risk and operations that actually close safety actions.

COMPANY INFORMATION

Company	COREON HOLDINGS Co., Ltd.
CEO	Howon Lee
Based in	Incheon, Republic of Korea
Business Model	B2B/B2G SaaS · Integration · Partnership
Core Product	COREON Safety AX Agent

TRUST STACK AT A GLANCE

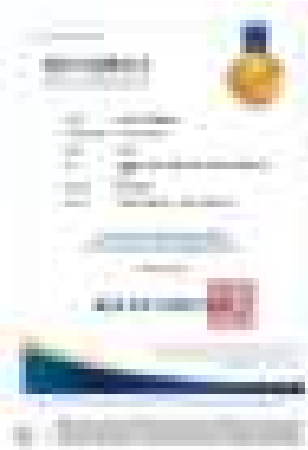

4	Registered Patents
T5	Technology Evaluation
Venture	Certified Company
SW	Software Business
Proc.	Public Procurement
Paid	Overseas Delivery

BUSINESS AREAS

Connecting detection technology to accountable safety execution

COREON complements existing detection and monitoring systems with human-led action, evidence, residual-risk review and authorized closure.

THE EXECUTION GAP

- 1 Signals exist without clear accountability**
Sensors, inspections and alarms are spread across systems
- 2 A "complete" action can still lack proof**
Before/after evidence, review and approval records may be missing
- 3 Post-action risk reduction may not be recorded**
Residual-risk reassessment and closure history are needed

COREON POSITION

01 Detection & Operations

Sensors · CCTV · AIoT · Digital Twin · EHS

02 COREON Execution

Human review · owner/deadline · action · evidence · residual risk

03 Verified Closure

Authorized approval · audit trail · Evidence Pack · management visibility

CORE PRINCIPLE

Preserve the strengths of existing systems, then structure downstream action, evidence and authorized closure.

01

Signal

02

Human Review

03

Action

04

Evidence

05

Closure

COREON Safety AX Agent

AI proposes. People review and approve. Evidence closes the loop.

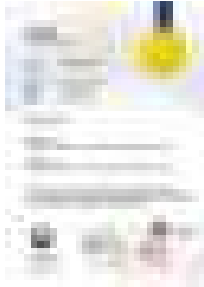

HOW THE PRODUCT WORKS

Capture & Inspect	Create one case from photos, voice, text and inspection results	AI Assist	Support classification, prioritization and next-action suggestions
Owner & Deadline	Make accountability, due dates and escalation explicit	Action & Evidence	Keep before/after proof and action history in one workflow
Residual-risk Review	Confirm whether risk actually decreased after action	Approval & Reporting	Connect authorized closure, Evidence Pack and management visibility

DEPLOYMENT | Standalone SaaS · multi-site rollout · system integration · OEM · co-development

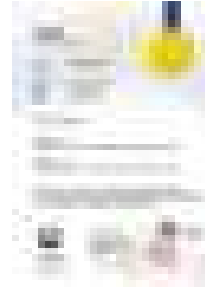

Technology backed by four registered patents and real delivery

A registered industrial-safety IP portfolio plus paid overseas industrial field delivery.

REAL DELIVERY

Industrial field technical consulting in Austin, Texas

Sep 2026 · Corporate contract → field delivery → settlement → tax invoice → corporate account payment

Expansion tracks: industrial software · energy · OEM/equipment · smart construction · public sector · railway · enterprise

A reusable application portfolio across industrial sectors

Adapt COREON to each customer's industry, operations and existing technology stack.

01	Construction & Plant	Risk assessment · TBM · contractors · project safety
02	Manufacturing & Automotive	Equipment · near miss · automation · multi-site
03	Energy & Power	HSE · maintenance · PTW · contractors
04	Logistics & Food	Loading · forklifts · hygiene · shift operations
05	Public & Infrastructure	Inspection · contractors · audit · reporting
06	Railway & Transport	Maintenance · supervision · contractors
07	Smart Construction	Digital Twin · LiDAR · AI Vision
08	AIoT & Monitoring	CCTV · sensors · 3D Digital Twin · API

Select and combine the modules that fit each operating environment.

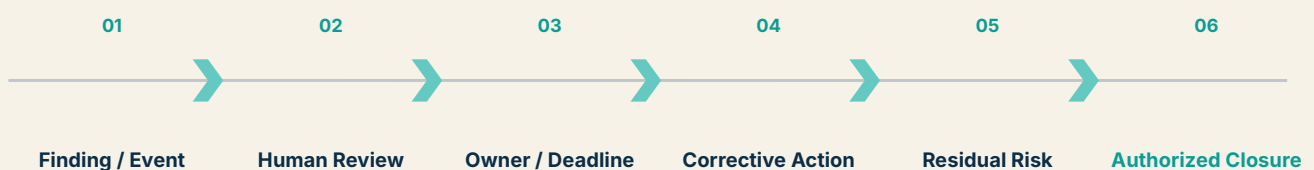

Construction · Plant · Smart Construction

Connect field findings, contractor safety and digital-site events to accountable action and closure.

KEY OPERATIONAL CHALLENGES

- 01 Findings across multi-trade contractor work can become disconnected from closure
- 02 TBM, inspections and digital-site events may remain separate from actual field action

COREON WORKFLOW

DEPLOYMENT APPROACH

Connect to existing risk assessment, TBM and inspection workflows for action and evidence management

Map Digital Twin, LiDAR and AI-vision events into human-reviewed safety execution

Deploy at one site or scale across sites with API integration and co-development options

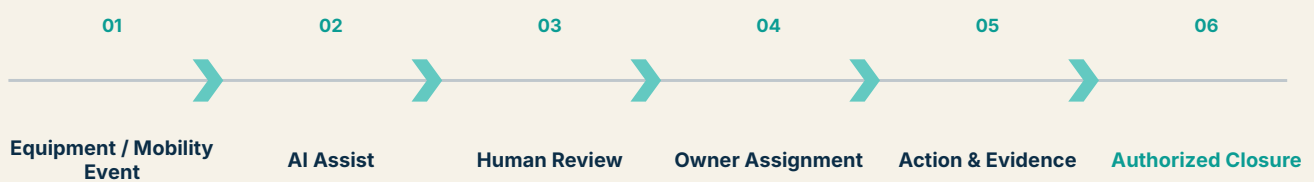

Manufacturing · Automotive · Mobility · Automation

Turn equipment alerts, near misses and automated-mobility risks into accountable safety execution.

KEY OPERATIONAL CHALLENGES

- 01 **Equipment, workplace and automation risks are fragmented across systems and local records**
- 02 **Multi-site operations need consistent action quality, evidence and closure standards**

COREON WORKFLOW

DEPLOYMENT APPROACH

- Deploy as standalone SaaS or a multi-site execution layer for production lines and automated zones
- Connect EHS, equipment alarms and CCTV/AI events to downstream corrective-action workflows
- Combine mobility IP and software through OEM, co-development or licensing models

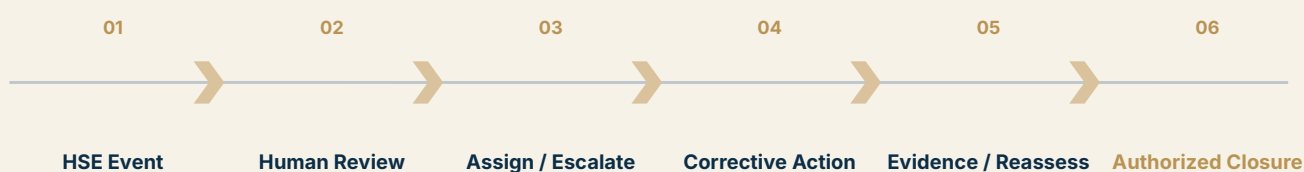

Energy · Power · Plant Operations

Add accountable action, evidence, residual-risk review and closure after existing HSE, maintenance and alarm systems.

KEY OPERATIONAL CHALLENGES

- 01 **Maintenance, turnaround and contractor work can generate many HSE findings at once**
- 02 **Corrective action and evidence may be managed separately after alarms or inspections**

COREON WORKFLOW

DEPLOYMENT APPROACH

Add a downstream action-management layer to existing HSE, alarm and inspection systems

Start with one equipment group or maintenance package and scale to multi-site execution

Choose API integration, enterprise rollout, co-development or global partnership models

Logistics · Food · Multi-site Operations

Standardize recurring safety actions across logistics hubs, loading, hygiene, cleaning and shift operations.

KEY OPERATIONAL CHALLENGES

- 01 **Site-to-site variation can cause delayed actions and recurring risks**
- 02 **Shift operations, contractors and transport partners need explicit ownership, handover and evidence standards**

COREON WORKFLOW

DEPLOYMENT APPROACH

- Standardize risk themes by logistics hub or process area, then scale across sites**
- Manage mobile reporting, before/after proof, training/TBM and contractor actions in one history
- Deploy standalone, add multi-site command center, or extend to customer/contractor portals

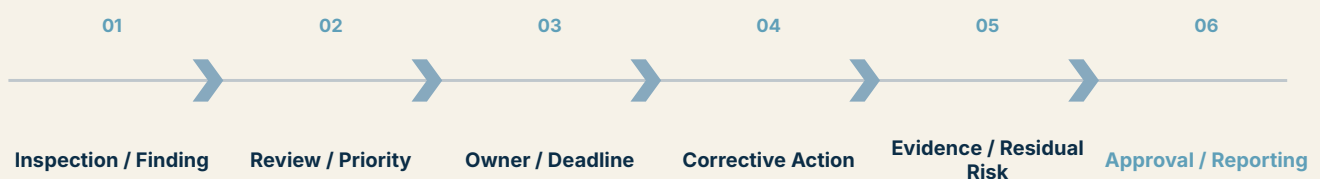

Public · Facilities · Infrastructure · Railway

Connect inspection, supervision and contractor findings to accountable action, evidence, approval and reporting.

KEY OPERATIONAL CHALLENGES

- 01 **Inspection findings can be disconnected from actual corrective action across public infrastructure**
- 02 **Contracted maintenance and supervision require structured completion evidence and approval history**

COREON WORKFLOW

DEPLOYMENT APPROACH

Deploy safety execution workflows across facilities, roads, railway assets or station environments

Strengthen Evidence Pack and audit-ready histories for management and oversight reporting

Support public SaaS, internal deployment, API integration and R&D/joint-validation models

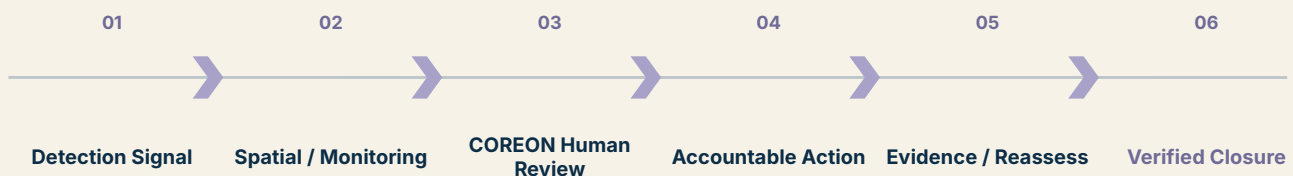

AIoT · CCTV · Digital Twin · Physical AI Ecosystem

Complement detection, spatial monitoring and industrial software with a downstream human-led execution and closure layer.

KEY OPERATIONAL CHALLENGES

- 01 **Sensors, CCTV, AIoT and Digital Twin are strong at detection and visualization, while action ownership sits elsewhere**
- 02 **Partners need a way to add execution without replacing their existing systems**

COREON WORKFLOW

DEPLOYMENT APPROACH

Start with minimum API/event mapping using event ID, payload, acknowledgement and retry

Embed a downstream Safety Execution Layer into industrial software, equipment or monitoring platforms

Expand through co-development, white-label, technology licensing or B2B/B2G joint proposals

Flexible deployment, integration and business partnership models

Customers can choose direct deployment, system integration, co-development, technology licensing, joint business or staged validation based on their environment and readiness.

SaaS Deployment

Operate COREON Safety AX Agent at one or multiple sites

Enterprise / Public Rollout

Configure organization-specific roles, workflows and governance

API / Event Integration

Connect to EHS, CCTV, AIoT, Digital Twin or industrial software

OEM / Technology Integration

Embed COREON as a downstream Safety Execution Layer

Co-development

Jointly design industry-specific functions, workflows and integrations

Technology Licensing

License registered IP and technical structures

B2B/B2G Joint Business

Jointly approach enterprise, public-sector and global customers

Pilot / PoC

Use staged validation only when it is the best entry path

Start at the level that fits the customer: direct deployment, integration, co-development, licensing, joint business or staged validation.

Operational value COREON is designed to deliver

The objective is not validation for its own sake, but stronger accountability, evidence quality, closure discipline and management visibility.

01

Accountability

Make owners, deadlines and approvals explicit

02

Execution

Convert safety signals into actual corrective action

03

Evidence

Maintain before/after proof, records and audit trails

04

Risk Control

Structure residual-risk reassessment after action

05

Management Visibility

See open, overdue and site-level action status

06

Scalability

Expand through SaaS, multi-site, API, OEM and co-development

COREON provides the operating technology that makes safety actions executable, evidential and responsibly closed.

Current Technology Position - Safety Execution

Public-safe product baseline: explain the operating model and assurance boundaries without exposing internal test counts, SHAs or environment identifiers.

SAFETY ASSURANCE PROTOCOL

Normalize human, field, external and system inputs into one canonical Safety Event structure.

VERIFIABLE CLOSURE PROOF

Maintain a verifiable closure state backed by action, evidence, residual risk and authority.

SAFETY EVIDENCE GRAPH

Trace relationships across events, people, actions, evidence, approvals and policy/version context.

FAIL-CLOSED & HUMAN AUTHORITY

Block closure when mandatory evidence, residual-risk review or approval is missing; final safety judgement remains human-authorized.

CONTINUOUS REAUTHORIZATION

Changes in evidence, policy, authority or environment can trigger review, reopen or reauthorization.

PUBLIC TRUTH BOUNDARY

Gate 2 is an internal engineering verification baseline, not an external certification. Device/protocol compatibility is not pre-assured before field interface validation.

Deployment, Partnership & Korea Market

Customers can choose direct deployment through API/OEM/joint business. Global industrial-tech companies entering Korea can engage COREON as a local integration, safety-execution and PoC partner.

Direct SaaS / Multi-site

Single-site to multi-site rollout

Enterprise / Public

Organization, authority and workflow rollout

API / Event Integration

Connect EHS, CCTV, AIoT, SCADA and robot events

OEM / White-label

Embed COREON as a downstream Safety Execution Layer

Co-development / Licensing

Industry workflow and IP collaboration

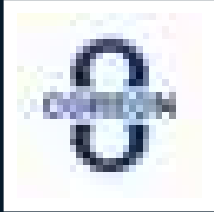

Korea Market Partner

Local PoC, B2B/B2G and channel partnership for global vendors

Partner proposition

Your platform detects and operates. COREON connects what happens next to accountable action, evidence, residual-risk review and verifiable closure.
